Super.com Hiring Team

Re: Software Development Engineering Intern – Infrastructure (DevOps) – 12 Months

Dear Super.com Hiring Team,

I am applying for the Software Development Engineering Intern – Infrastructure (DevOps) role for the September 2026 to August 2027 term. I am a Computer Science student at Laval University, based in Quebec City and authorized to work in Canada. Super.com's remote-first Canada internship is especially appealing because the infrastructure team works on the build, deploy, monitoring, database, and cache systems that let product teams ship faster and more safely.

My strongest match is practical backend and product engineering with Python, JavaScript, REST APIs, PostgreSQL, Redis, Docker, and Git. On Mafhoum, I co-founded and architected a full-stack learning platform, designed more than 50 REST API endpoints, modeled data with Prisma/PostgreSQL, used Redis and Socket.IO for real-time features, and kept the local environment Dockerized for development. That experience maps well to an infrastructure team supporting Python/JavaScript services, containerized workflows, Postgres, Redis, and developer productivity.

I also bring a strong automation mindset. My Multi-Agent AI Orchestrator uses Python, Discord.py, JSONL history, persistent memory, and scheduled agent handoffs, which trained me to think carefully about reliable background workflows, observability of state, and reducing repetitive manual coordination. In my HMD Agro internship, I am integrating an API-backed AI module and reporting interface into an existing farm-management platform, coordinating requirements and delivery milestones in a remote setting.

I would be excited to contribute to Super.com's deployment and developer-tooling work while learning more about Kubernetes, Terraform, Helm, Datadog, and production infrastructure from your engineering team. Thank you for your consideration.

Sincerely,
Mohamed Slim
