Dear Hiring Team,

I am a Computer Science student at Laval University, and I am applying for Veeva Systems' Intern: Software Engineer in Test role in Toronto. Veeva's focus on cloud software for the life sciences industry stands out to me because the role combines software engineering, product quality, and customer-impacting reliability.

My project work has given me a strong foundation for API and web-application testing. In Mafhoum, I co-founded and architected a full-stack learning platform with 50+ REST API endpoints, authentication flows, PostgreSQL, Redis, Socket.IO, and Dockerized development environments. In UTask, I implemented task-board features with drag-and-drop and real-time synchronization while achieving full feature coverage against a Swagger/OpenAPI backend.

I also bring practical web delivery experience from my Web Developer Internship at CHC Navigation, where I shipped a responsive product showcase website that reached production deployment and client approval. Across my projects and coursework, I have worked with Java, JavaScript, SQL, data structures and algorithms, object-oriented programming, TDD, REST APIs, and debugging-oriented development. My current work at Retraite Quebec has also strengthened my attention to detail while handling regulated, sensitive files under deadlines.

I am authorized to work in Canada and do not require sponsorship. I would welcome the opportunity to contribute to Veeva's QA team by developing reliable API and UI test coverage, improving documentation, and learning from engineers building cloud software for life sciences customers.

Sincerely,
Mohamed Slim
