Hiring Team
Geotab

Dear Hiring Team,

I am applying for the DataOps Developer Intern role for Fall/September 2026 in Oakville. I am a Computer Science student at Laval University, authorized to work in Canada, and interested in Geotab's connected-transportation platform because the role connects software development, Python, SQL, data pipelines, performance troubleshooting, and collaboration with Data Engineering and Data Science teams.

My strongest match is practical experience building data-backed systems. In Mafhoum, a production-bound learning platform I co-founded, I designed 50+ REST API endpoints across authentication, communities, courses, gamification, and payments; modeled data with Prisma and PostgreSQL; implemented real-time behaviour with Socket.IO; and worked in Dockerized local environments. That experience maps well to understanding how application behaviour, APIs, data models, and scalability concerns interact.

I also bring hands-on Python and automation experience. My Multi-Agent AI Orchestrator uses Python, Claude Agent SDK, Discord.py, JSONL history, scheduled workflows, and persistent memory, while VoiceBubble combines MLX Whisper transcription, Claude-based refinement, PyQt6, and SQLite. These projects strengthened my habits around clear logs, iterative debugging, and writing maintainable tooling, which are relevant to supporting Airflow-style data operations even though I am not claiming prior production Airflow experience.

I understand this internship emphasizes Python and SQL pipeline development, quality assurance, design documentation, log and performance analysis, and working closely with Data Engineering and Data Science. I can bring verified Python, SQL, PostgreSQL, APIs, Docker, documentation, and careful troubleshooting skills, plus a strong willingness to learn Geotab's data operations environment during a 12-month internship.

Sincerely,
Mohamed Slim
