Dear Hiring Manager,

I am a Computer Science student at Laval University, and I am excited to apply for IBM's Data Services Developer Intern (Sept. 2026, 4 months) role in Toronto. The posting's mix of data models, data pipelines, SQL, Python automation, and application development aligns closely with the work I have been doing through projects and coursework.

In Mafhoum, I co-founded and architected a full-stack platform with PostgreSQL, Redis, Prisma, Socket.IO, and 50+ REST API endpoints. That work taught me how to translate requirements into reliable backend systems, structure data models, and ship features with a production mindset. In VoiceBubble, I built a macOS dictation app in Python with local MLX Whisper transcription, SQLite, and Claude-based refinement, which strengthened my automation and data-processing habits.

I also built a Python multi-agent orchestration system with the Claude Agent SDK, persistent JSONL memory, and role-based workflows. Across these projects, I have developed a comfortable workflow in Python, SQL, Git, and Docker, along with the habit of iterating quickly and communicating clearly when requirements change.

I am authorized to work in Canada, available immediately, and committed to returning to full-time studies after the work term. I would welcome the opportunity to contribute to IBM and learn from a team that works across data, software, and cloud environments.

Thank you for your time and consideration.

Sincerely,
Mohamed Slim
