Dear Hiring Manager,

I am a Computer Science student at Laval University, and I am excited to apply for Intel's Compiler Engineering Intern role in Toronto. The role's focus on compiler work and performance-oriented software matches my interest in building reliable systems and my experience shipping practical software across web, AI, and client-server projects.

At Mafhoum, I co-founded a production-bound community learning platform and designed 50+ REST API endpoints across authentication, communities, courses, gamification, and payments. I also implemented Socket.IO real-time interactions, JWT rotation, OAuth login flows, Prisma schema modeling, and Dockerized local environments to keep the stack reproducible and easy to iterate on.

I have also built VoiceBubble, a macOS dictation app that combines local MLX Whisper transcription with Claude-based refinement, and a Python-based multi-agent orchestration system with the Claude Agent SDK. Those projects strengthened my C++, Python, debugging, and delivery discipline while keeping me close to practical software development.

I am authorized to work in Canada, available immediately, and open to Toronto. I would welcome the opportunity to contribute to Intel with careful implementation, strong fundamentals, and a willingness to learn from the team.

Thank you for your time and consideration.

Sincerely,
Mohamed Slim
