Kinaxis Hiring Team  
Re: Co-op/Intern Associate Software Developer – Core Algorithms

Dear Kinaxis Hiring Team,

I am applying for the Co-op/Intern Associate Software Developer role starting September 2026. I am a Computer Science student at Laval University, based in Quebec City and authorized to work in Canada. Kinaxis stands out to me because the Core Algorithms team works directly on testing and improving analytics capabilities in Maestro, a supply-chain platform used by large global customers.

My strongest match is a combination of software engineering, data-backed systems, and algorithm-focused coursework. Through my Laval studies I have worked with data structures, algorithms, machine learning, databases, operating systems, and software engineering. In projects, I use Python, C++, JavaScript, SQL, PostgreSQL, Docker, scikit-learn, Pandas, and API design, which maps well to the role's focus on validating heuristic algorithms, processing large datasets, and creating systems that improve reliability.

On Mafhoum, I co-founded and architected a full-stack learning platform, designed more than 50 REST API endpoints, modeled data with PostgreSQL/Prisma, and implemented real-time features with Socket.IO. My Multi-Agent AI Orchestrator and VoiceBubble projects also strengthened my Python, automation, and AI experimentation habits. In my CHC Navigation internship, I shipped a client-approved web product, and in my current Retraite Quebec role I work carefully with sensitive, high-volume data under deadlines.

I would be excited to bring that practical engineering discipline to Kinaxis while learning from the Core Algorithms team on data, quality, and performance work in a real supply-chain product. Thank you for your consideration.

Sincerely,  
Mohamed Slim
