Hiring Team
Themis Intelligence

Dear Hiring Team,

I am applying for the Research Engineer - Post-training (Co-op / Intern) role in Mississauga. I am a Computer Science student at Laval University, authorized to work in Canada without sponsorship, and I am interested in AI engineering work where reliability, grounding, evaluation, and practical user workflows matter. The saved posting evidence describes a 12-month hybrid role focused on LLM grounding, hallucination checks, retrieval and prompt testing, evaluation pipelines, Python, and data tools.

My strongest match is hands-on LLM tooling and workflow experimentation. I built a Discord-based multi-agent AI orchestration system in Python using Claude Agent SDK, Discord.py, JSONL conversation history, isolated prompts, and persistent markdown memory so specialized agents could retain role-specific context across sessions. That project gave me practical experience designing prompts, managing state, and observing repeated model behavior across different roles and tasks.

I also built VoiceBubble, a macOS push-to-talk dictation app combining local MLX Whisper transcription, Claude-based refinement, PyQt6, and SQLite. The project required turning noisy speech input into cleaner output, managing per-app context profiles, and integrating AI behavior into a usable desktop workflow. In parallel, I co-founded Mafhoum, a production-bound learning platform built with React 19, Express.js, PostgreSQL, Redis, Prisma, Socket.IO, and Docker, where I designed 50+ REST API endpoints and implemented authentication, real-time interactions, and data-backed product features.

Themis Intelligence stands out because the role connects AI model behavior with the engineering discipline needed to make outputs dependable. I would be excited to contribute my Python, LLM tooling, prompt engineering, Whisper, Pandas, and full-stack development background while learning from your team on post-training, grounding, and evaluation systems.

Sincerely,
Mohamed Slim
